Joint letter on ‘sovereignty requirements’ in candidate European Cybersecurity Certification Scheme for Cloud Services

Brussels, 16 June 2022

The European Union Agency for Cybersecurity (ENISA) is in the process of releasing a new draft of the candidate European Cybersecurity Certification Scheme for Cloud Services (EUCS). This new draft will incorporate so-called sovereignty requirements concerning data localisation, headquarters and corporate control that we fear would severely damage our digital economy.

The proposed requirements, which aim to make EU data ‘immune’ from non-EU laws, fundamentally misunderstand the reality of European businesses operating internationally. As we explain at length in a separate report, these requirements will restrict choice and quality in the European cloud market without solving the issue of non-EU access they purport to tackle.

Instead, they would have the very illogical consequence of making it more difficult for European companies to operate globally, including with our crucial US ally, hampering their growth and competitiveness. The rules will also have a negative impact on cybersecurity, as under this scheme no provider will be able to offer high-level EU-certified data transfers to third countries. This is contrary to the objectives of a cybersecurity certification scheme.

This is a political discussion, not a technical one. Its major economic implications should be transparently and seriously discussed among Member States. We therefore urge Member States to reject the introduction of such requirements in the updated candidate scheme, and to request a more thorough impact assessment of these proposals including all relevant stakeholders.
